

Applied AI Course Paths

Three structured paths from first prompt to production AI engineering.
Live cohorts · Real labs · Portfolio capstones · Nixpert certificate

```
$ nixpert enroll --track applied-ai
✓ AI Essentials ..... ready
✓ AI Power User ..... ready
✓ AI for Programmers ..... ready

```

Program Overview

Pick the path that matches where you are. Every path is taught live, recorded for revision, and finishes with a graded capstone project you can show employers.

	Path 1 AI Essentials	Path 2 AI Power User	Path 3 AI for Programmers
Duration	4 weeks	6 weeks	10 weeks
Live sessions	8	12	20
Level	Beginner	Intermediate	Advanced / Developer
Prerequisites	None	None (Path 1 included as recordings)	Basic Python (Paths 1-2 included as recordings)
Core tools	ChatGPT, Claude, Gemini, NotebookLM	+ Midjourney, Canva AI, Codex, Claude Code, n8n / Zapier	+ OpenAI & Anthropic APIs, RAG, MCP, LM Studio, Ollama, Hugging Face
Capstone	Personal AI workflow	Automated workflow or no-code tool	Deployed RAG + MCP or local-LLM application
Launch price	₹ 2,999	₹ 5,999	₹ 10,999
List price	₹ 2,999	₹ 6,999	₹ 12,999

Every cohort includes

- Weekly live classes with Q&A, recorded and available for 12 months.
- Hands-on labs for every module, with 1:1 support when a lab fights back.
- Private community chat and weekly office hours.
- A graded portfolio capstone and a Nixpert completion certificate.
- Upgrade credit: alumni move to a higher path by paying only the difference plus ₹ 500.

Path 1 · AI Essentials

4 weeks · 8 live sessions · Beginner · ₹ 2,999

For working professionals, students, founders, and anyone who wants to use AI tools confidently every day. No technical background required. You leave able to choose the right tool, write prompts that work, and run a personal AI workflow.

Audience	Format	Outcome
Non-technical professionals and students	2 live sessions / week + guided practice	Daily AI fluency across ChatGPT, Claude, Gemini

Week 1 · The AI Landscape

- What LLMs actually are: tokens, context, training, and why models hallucinate (no math).
- The big three hands-on: ChatGPT, Claude, and Gemini. Strengths, pricing, and when to use which.
- Accounts and setup: free vs paid tiers, web vs mobile, data and privacy settings.

Lab: Run the same five tasks across all three tools and compare results.

Week 2 · Prompting That Works

- Prompt structure: role, context, task, format, and examples.
- Iterating on outputs: follow-ups, constraints, and asking the model to critique itself.
- Common mistakes: vague asks, missing context, trusting confident nonsense.

Lab: Rewrite ten weak prompts into strong ones and measure the difference.

Week 3 · Text, Images, and Voice

- Writing workflows: emails, reports, summaries, translation, and tone control.
- Image generation basics with DALL-E and Gemini: describing scenes, styles, and revisions.
- Voice modes and file uploads: analysing PDFs, spreadsheets, and screenshots.

Lab: Produce a one-page report with an AI-generated illustration from a raw data file.

Week 4 · AI in Your Daily Work

- Claude Projects and Custom GPTs: packaging repeatable tasks with instructions and files.
- NotebookLM for research, study, and summarising large document sets.
- Staying safe: privacy, what never to paste into a chatbot, and verifying AI output.

Capstone

Design, build, and demo a personal AI workflow, for example a weekly report generator, a study assistant, or a client email pipeline. Presented live in the final session.

Path 2 · AI Power User

6 weeks · 12 live sessions · Intermediate · ₹ 6,999 (launch ₹ 5,999)

Everything in AI Essentials, included as recorded prework, plus the skills that separate casual users from power users: advanced prompting, creative tools, no-code building, and automation. You leave able to ship small tools and automated workflows without writing code.

Audience	Format	Outcome
Professionals, creators, analysts, founders	2 live sessions / week + project labs	Ship AI-built tools and automated workflows

Weeks 1-2 · Advanced Prompting and Workspaces

- System prompts, structured outputs, step-by-step reasoning, and long-context techniques.
- Claude Projects and Artifacts, ChatGPT Projects, and Gemini Gems as reusable workspaces.
- Model tiers and cost: knowing when a smaller, cheaper model is the right call.

Lab: Build a reusable workspace that handles a real recurring task end to end.

Week 3 · Visual and Creative AI

- Image generation deep dive: Midjourney, DALL-E, and Imagen. Style control, editing, upscaling.
- Design tools: Canva AI, Figma AI, and presentation generators for brand-consistent output.
- Video and audio overview: Veo, Runway, and ElevenLabs, and where they fit.

Lab: Produce a small brand kit: logo concepts, social images, and a five-slide deck.

Week 4 · AI-Assisted Building (No-Code / Low-Code)

- Codex and Claude Code from a non-programmer's seat: building tools by describing them.
- Vibe coding in practice: a landing page, a calculator, and a small dashboard.
- Judgement: what is safe to ship, what needs a developer, and how to ask for help.

Lab: Build and publish a working single-page web tool from a plain-English spec.

Week 5 · Automation and Agents

- Connecting AI to your tools with Zapier, Make, and n8n.
- Agents in practice: scheduled tasks, deep research modes, and multi-step workflows.
- Reliability: where automations break and how to add checks.

Lab: Automate a three-step workflow, for example form to summary to email.

Week 6 · Capstone and Career Positioning

- Build and present a real deliverable: an automated workflow, a no-code tool, or a content pipeline.
- Positioning AI skills credibly on your resume and LinkedIn.

Path 3 · AI for Programmers

10 weeks · 20 live sessions · Advanced · ₹ 12,999 (launch ₹ 10,999)

The full engineering path. Everything in Paths 1 and 2 as recordings, plus APIs, tool use, production RAG, MCP, local LLMs, and Hugging Face. You leave with a deployed AI application in your portfolio and the judgement to build LLM systems that survive production.

Audience	Prerequisite	Outcome
Developers, SREs, DevOps, and career switchers	Basic Python, or the willingness to learn fast	Build and deploy RAG, MCP, and local-LLM systems

Weeks 1-2 · LLM Foundations for Engineers

- Transformers in practice: tokens, embeddings, context windows, temperature, and sampling.
- OpenAI, Anthropic, and Gemini APIs: chat completions, streaming, and structured outputs.
- Cost engineering: prompt caching, model selection, and token budgeting.

Lab: Build a multi-provider CLI chat client with streaming and cost tracking.

Week 3 · Tool Use and Function Calling

- Function calling (OpenAI) and tool use (Claude): JSON schemas, parallel calls, error handling.
- Designing tools models can actually use: naming, descriptions, and guardrails.

Lab: Build a CLI assistant that calls live weather, search, and database APIs.

Weeks 4-5 · RAG from Scratch to Production

- Chunking strategies, embedding models, and vector databases: Chroma, pgvector, Pinecone.
- Retrieval quality: hybrid search, reranking, and context packaging.
- Evaluation and failure modes: measuring answer quality, catching silent retrieval failures.

Lab: Build a RAG chatbot over your own documentation, then deliberately break it and fix it.

Week 6 · Model Context Protocol (MCP)

- MCP architecture: servers, clients, resources, tools, and prompts.
- Building an MCP server that exposes a database and a filesystem, wired into Claude.
- Security: safe tool exposure, permissions, and prompt injection awareness.

Lab: Ship a working MCP server and demo it live from Claude.

Weeks 7-8 · Local LLMs and Hugging Face

- Ollama and LM Studio: running Llama, Qwen, and Nemotron locally.
- Quantization, GGUF, context sizing, and GPU vs CPU realities on real hardware.
- Hugging Face: the hub, transformers, datasets, and inference endpoints.
- Fine-tuning intro: when to fine-tune vs RAG vs prompt, with a LoRA walkthrough.

Lab: Serve a quantized local model behind an OpenAI-compatible API and benchmark it.

Week 9 · Agentic Coding and Agents

- Claude Code and Codex CLI in real repositories: planning, reviewing, and guardrails.
- Building a simple agent loop with tool use and memory.

Lab: Use an agentic coding tool to add a tested feature to an existing codebase.

Week 10 · Production and Capstone

- Evals and observability, prompt injection defence, and deployment patterns.
- Capstone build week with 1:1 reviews.

Capstone

A deployed project combining RAG and MCP, or a local-LLM application, presented for your portfolio and reviewed by the instructor team.

Pricing and Enrollment

Transparent pricing, launch discounts for the first cohort, and an upgrade path that rewards staying with Nixpert.

Path	Duration	List price	Launch price (first cohort)
AI Essentials	4 weeks	₹ 2,999	₹ 2,999
AI Power User	6 weeks	₹ 6,999	₹ 5,999
AI for Programmers	10 weeks	₹ 12,999	₹ 10,999
All-Access Bundle (all three paths)	Flexible	₹ 19,999	₹ 15,999

Offers and policies

- **Upgrade credit:** alumni of any path can move up by paying only the price difference plus ₹ 500.
- **Corporate and team training:** custom batches for teams of 5 or more. Write to hello@nixpert.in for a quote.
- **Payment:** UPI, cards, and net banking. EMI available on Path 3 and the bundle.
- **Refunds:** full refund up to 48 hours after the first live session, no questions asked.
- **Access:** recordings, labs, and community access for 12 months from enrollment.

How to enroll

- Visit nixpert.in and submit the enrollment form with your chosen path.
- We reply with the next cohort dates and an invite to a free intro call.
- Reserve your seat. Cohorts are capped to keep labs and 1:1 support meaningful.
